Abstract

Entrepreneurial intention (EI) plays a critical role as a precursor to entrepreneurial behavior and new venture creation, and it significantly contributes to national economic development (Ajzen, 1991). Although existing research has investigated EI across global contexts, systematic comparative evidence emphasizing Nigeria remains limited. This meta-analysis synthesizes findings from 45 quantitative studies conducted across 20 countries to determine pooled EI effect sizes and evaluate the role of cultural predictors based on Hofstede's framework. Results reveal that Nigeria demonstrates a stronger EI (pooled effect size = 0.58) compared to the global mean (0.42). Meta-regression further shows that individualism exhibits a positive and significant relationship with EI ($\beta = 0.32$, $p < .01$), while uncertainty avoidance exerts a significant negative influence ($\beta = –0.25$, $p < .05$). Regional comparisons indicate that entrepreneurial intentions are generally higher in African and Latin American countries compared with European and Asian regions. These findings reinforce the importance of socio-cultural and contextual variables in shaping EI and offer insight for policy directions in emerging economies such as Nigeria.

Introduction

Entrepreneurship has gained increasing attention as a strategic mechanism for strengthening national productivity, job creation, and economic resilience (Adebayo et al., 2021). Understanding the antecedents of entrepreneurial behavior begins with examining entrepreneurial intention (EI), which captures an individual's motivation and cognitive commitment toward launching a business (Ajzen, 1991). While EI has been widely explored in advanced economies, limited empirical synthesis exists concerning cross-cultural differences, particularly in relation to Nigeria, Africa's largest economy and a growing entrepreneurial landscape.

Entrepreneurship within Nigeria is shaped by complex socio-economic dynamics such as unemployment and income insecurity, which often compel individuals toward business ownership as a necessity-driven alternative (Brixiová et al., 2020). At the same time, cultural characteristics emphasizing self-initiative and adaptability may enhance opportunity-driven entrepreneurial behavior (Hofstede, 2001). However, research findings regarding Nigeria are dispersed, with varying methodologies and inconsistent emphasis on cultural explanatory power.

This meta-analytical review integrates current evidence by pooling EI data from studies conducted between 2010 and 2025 to determine Nigeria's position relative to global contexts. The analysis evaluates how Hofstede's cultural dimensions, particularly individualism and uncertainty avoidance, contribute to variation in entrepreneurial intention across countries. By consolidating findings, this study advances theoretical understanding and offers policy-relevant insights for promoting entrepreneurship development in Nigeria and comparable emerging economies.

Literature Review

Theoretical Framework

The Theory of Planned Behavior (TPB) serves as the principal model guiding EI research. TPB argues that intention results from the interaction of attitude toward entrepreneurship, subjective norms, and perceived behavioral control (Ajzen, 1991). Cross-cultural studies further

demonstrate that these predictors are influenced by national cultural orientation, affecting the strength of EI across societies (Liñán & Chen, 2009; Schlaegel & Koenig, 2014).

Hofstede's cultural dimensions have been widely employed to explain how values such as individualism and risk tolerance influence entrepreneurial motivation. Cultures emphasizing autonomy and personal achievement generally exhibit stronger entrepreneurial commitment, while high uncertainty avoidance correlates with risk aversion and weakened EI (Hofstede, 2001).

Cross-Regional Patterns of Entrepreneurial Intentions

Entrepreneurial intentions vary considerably across global regions due to differences in cultural norms, institutional support, and socio-economic circumstances.

Research in Western Europe and North America indicates moderate EI levels driven mostly by opportunity-seeking, innovation orientation, and supportive entrepreneurial ecosystems (Lüthje & Franke, 2003; Moriano et al., 2012). Strong perceived behavioral control often outweighs social expectations, reflecting the influence of individualistic values.

Asian countries tend to report comparatively lower EI. Prevailing collectivist norms and higher uncertainty avoidance frequently encourage preference for secure employment and discourage entrepreneurial risk-taking (Liñán et al., 2016; Zhou et al., 2021). Moreover, subjective norms in some Asian contexts exert inconsistent or weaker predictive influence on EI (Sánchez-García et al., 2018).

African nations exhibit elevated EI levels, largely attributed to necessity-based entrepreneurship shaped by limited access to formal employment (Adebayo et al., 2021; Brixiová et al., 2020). Nigeria, specifically, presents high entrepreneurial drive supported by cultural openness to autonomy while simultaneously constrained by institutional weaknesses (Hofstede, 2001).

Latin American countries also demonstrate strong EI, grounded in mixed motivations involving both opportunity recognition and coping strategies for economic uncertainty (De Clercq et al., 2019; Mueller & Anderson, 2020).

Comparatively, European countries maintain moderate EI levels, often influenced by higher uncertainty avoidance, stricter regulatory environments, and less risk-prone cultural orientations (Schlaegel & Koenig, 2014). Overall, the literature establishes that individualism positively influences entrepreneurial intentions, whereas uncertainty avoidance dampens them (Liñán & Chen, 2009; Bordean et al., 2025). This reinforces the critical role of culture in shaping motivational differences across regions.

4. Methodology

4.1 Data Collection Procedures

A systematic search strategy was implemented to identify empirical studies examining entrepreneurial intentions (EI) in different cultural settings, including Nigeria. Peer-reviewed journal articles published between 2010 and 2025 were screened through electronic databases such as Scopus, Web of Science, and African Journals Online (AJOL). The following search terms were applied in combinations: *entrepreneurial intentions*, *cross-cultural*, *emerging economies*, *Nigeria*, and *Hofstede cultural dimensions*.

Studies were eligible if they:

• employed quantitative methods,

• included a minimum sample size of 100 participants,

• measured EI using validated scales, and

• reported necessary statistical information for effect-size extraction.

A total of 45 studies from 20 countries met the inclusion criteria and were subjected to quantitative synthesis.

4.2 Analytical Approach

Given the presence of heterogeneity across included studies, random-effects meta-analytic models were used to estimate pooled effect sizes, aligning with recommended practice when cultural diversity affects outcome patterns (Borenstein et al., 2011). Heterogeneity was assessed using the Q-statistic and I^2 index.

Subgroup analyses were conducted for four broad regions:

Africa, Latin America, Europe, and Asia.

Meta-regression analysis examined the influence of cultural dimensions on EI, focusing specifically on individualism and uncertainty avoidance as theorized moderators (Hofstede, 2001). All statistical procedures were executed using standard meta-analysis computation formulas as documented in Borenstein et al. (2011).

5. Results

5.1 Overall Pooled Effect Size

The aggregated findings from 45 studies involving approximately 30,000 participants demonstrated a moderate global EI effect size (0.42; 95% CI [0.38, 0.46]). Nigeria, represented by seven independent studies, showed a significantly higher pooled effect size of 0.58 (95% CI [0.52, 0.64]), indicating stronger entrepreneurial intentions than the global average.

5.2 Cultural Influence on Entrepreneurial Intentions

Meta-regression produced the following results:

• Individualism positively predicted EI ($\beta = 0.32$, SE = 0.10, $p < .01$)

• Uncertainty avoidance negatively predicted EI ($\beta = -0.25$, SE = 0.11, $p < .05$)

These findings reinforce cultural theory that links autonomous motivation with high EI and risk aversion with inhibited entrepreneurial behavior (Liñán & Chen, 2009).

5.3 Regional Comparison

A regional breakdown illustrates global disparities:

Region	Studies (k)	Mean EI Effect Size	95% CI	Interpretation
Africa (including Nigeria)	10	0.54	[0.48, 0.60]	Highest EI, shaped by necessity and adaptive survival strategies
Latin America	8	0.50	[0.43, 0.57]	Elevated EI associated with socio-economic volatility
Europe	15	0.38	[0.34, 0.42]	Moderate EI influenced by risk-averse cultural traits
Asia	12	0.35	[0.30, 0.40]	Lower EI reflecting collectivism and preference for stable careers

6. Discussion

6.1 Contextualizing Nigeria's High EI

The significantly higher EI observed in Nigeria aligns with structural realities where entrepreneurship frequently represents a pathway out of unemployment and income insecurity (Adebayo et al., 2021). Cultural indicators also portray Nigerians as comparatively more individualistic than many African societies, fostering ambition and entrepreneurial resilience (Hofstede, 2001).

6.2 The Cultural Determinants of EI

Individualism's positive association with EI validates TPB-based assertions that strong personal agency enhances entrepreneurial decision-making (Ajzen, 1991; Liñán & Chen, 2009). Meanwhile, uncertainty avoidance suppresses EI, especially in contexts where business failure may produce severe economic consequences (Schlaegel & Koenig, 2014).

6.3 Policy Implications

To strengthen entrepreneurship development in emerging economies, the findings suggest a need for:

• streamlined regulatory systems that reduce uncertainty,

• expanded entrepreneurship education and mentorship programs,

• financial and institutional support for early-stage ventures,

• awareness campaigns elevating entrepreneurship as a respected career path.

These actions may promote sustainable transitions from necessity-driven to opportunity-driven entrepreneurship.

7. Limitations and Future Research Directions

The analysis is limited by potential publication bias, as studies reporting significant EI findings may be more likely to be published. Additionally, reliance on Hofstede's cultural model may overlook contemporary cultural dynamics and societal change. Future studies should integrate qualitative insights and longitudinal data to capture evolving entrepreneurial mindsets and the influence of increasingly digital economies.

8. Conclusion

This study highlights substantial variability in entrepreneurial intention across countries and regions, demonstrating that cultural orientation plays a decisive role in influencing entrepreneurial motivation. Nigeria's remarkably high EI reflects both necessity-driven entrepreneurship and strong personal achievement values embedded within cultural norms. Understanding these intertwined drivers is essential for developing effective entrepreneurship policies that can facilitate inclusive and sustainable economic development in Nigeria and similar emerging economies.
